

Thomas Darmon

M.S. Geology (2015)

Thomas Darmon was raised in Brimfield, Ohio and after high school attended the University of Akron where he completed his Bachelors of Science degree in the spring of 2010. Taking the advice from his professors at the University of Akron, he decided to expand his education at the University of Toledo and pursue a Master of Science degree in Geology. Upon arriving at the University of Toledo, he began working under the supervision of Dr. David Krantz.

His work under Dr. Krantz included field studies and geophysical investigations using Ground Penetrating Radar (GPR) on Assateague Island in Maryland. His research eventually led to the culmination of his thesis entitled "Geophysical Applications to Measure or Monitor the Distribution of Fresh, Brackish, and Saline Groundwater beneath a Barrier Island" and the successful completion of a Master of Science Geology degree in 2015. Tom also enjoyed time outside his own research to assist other graduate students with reviews and laboratory work associated with their thesis work.

Tom seeks to use his Master's degree as a representation of the hard work and dedication he is willing and able to apply to a given project. Presently, he lives in Stow, Ohio and has accepted a position at Arcadis U.S. Inc. a global design, engineering and management consulting company. His employment at Arcadis has enabled him to learn state regulatory policies and how best to apply his education in the workplace. Looking forward to the future, he wants to use his degree and experience to pursue a career in higher management that will require the technical skills he has honed while on the job and at the University of Toledo.

"Advancement and success is all about communication and collaboration with others."
