Notes:

GNI PPP per capita is gross national income in purchasing power parity (PPP) divided by mid-year population. GNI PPP refers to gross national income converted to “international” dollars using a purchasing power parity conversion factor. PPP adjusts exchange rates to relative purchasing power in different countries, providing a more accurate basis of comparison for GNI. Data are from the World Bank.

Life Expectancy is the average number of years a newborn infant can expect to live under current mortality rates.

Adult literacy rate, population 15+ years, both sexes (%)

Prevalence of Undernourishment is reported for the most recent data available for each country (some are earlier years).

ND=No Data (in this case it likely means that percent undernourished is too small to report)
